

8. Overriding

- Overriding works for inheritance relationship
- When child class change his parent properties , that is overriding

```
class Father {
  first_name='Jhon'
  last_name='Dee'
  getName() {
    return (`The name of the person is ${this.first_name} ${this.last_name}`)
  }
}

class Son extends Father{
  first_name='Jhon Junior'
}

const SonObj = new Son();
console.log(SonObj.getName());
```
